ACKNOWLEDGEMENT

This space is dedicated to acknowledge all those who have helped in bringing this project to fruition.

We are greatly indebted to our guide ***Prof. S. B. Patil*** and HOD ***Dr. Shivaleela Arlimatti***, for her unstinted support and valuable suggestions. We are grateful to her for the guidance and for her unending patience and keeping our spirits high throughout. and Principal, **Dr. D. N. Mane** for being source of inspiration and providing us the opportunity to work on this project.

We extend heartfelt thanks to all the teaching and non-teaching staff of the department of MCA for their assistance and cooperation.

Finally, we would like to thank our parents and friends for their moral support and encouragement throughout our academics.

ABSTRACT

NearNest is a comprehensive community and facility management platform designed to streamline communication and issue resolution between residents and administrators. It addresses the common inefficiencies found in traditional community management, such as lost maintenance requests, lack of transparency in complaint tracking, and disjointed vendor management. As residential complexes and communities grow, administrators often face challenges in manually tracking user grievances, assigning tasks to vendors, and keeping residents updated on the status of their requests.

The primary objective of NearNest is to develop a robust, efficient, and user-friendly solution that centralizes community operations by providing a seamless interface for users to submit and track complaints, and for administrators to manage users, update complaint statuses, and coordinate with service vendors. The platform ensures role-based access control, allowing for secure authentication and tailored dashboard experiences for both standard users and administrative personnel.

Implementation utilizes Flutter (Dart) on the frontend to deliver a responsive, cross-platform experience (mobile and web) with a modern, intuitive UI. The backend is powered by a Node.js and Express.js architecture, providing robust RESTful APIs for authentication, complaint routing, and administrative controls. Data is securely handled and persisted (likely utilizing a NoSQL database like MongoDB, given the architecture), ensuring high availability and fast query responses for dynamic state updates.

Expected outcomes include drastically reduced resolution times for community issues, enhanced transparency and trust between residents and management, streamlined vendor coordination, and a highly scalable architecture capable of integrating future modules such as automated billing, facility booking, or real-time chat support.

keywords :

Community Management System

Complaint Resolution Platform

Role-Based Access Control

(RBAC) Cross-Platform UI

(Flutter/Dart) RESTful API

Backend (Node.js) Real-time

Status Tracking

Vendor and Maintenance Coordination

Scalable Administrative Dashboards
